Base station communication equipment is placed on the roof

Overview

What is a rooftop Telecom Tower?

Rooftop telecom towers, often called rooftop cell towers or roof top antenna towers, are specialized structures installed on building rooftops to support antennas and equipment for wireless communication. Typically ranging from 3 to 30 meters in height, these towers use hot-dip galvanized steel (ASTM A123) for over 30 years of durability.

What are the different types of base stations?

Some basic types of base stations are as follows: Macro-base stations are tall towers ranging from 50 to 200 feet in height, placed at strategic locations to provide maximum coverage in a given area. Those are equipped with large towers and antennas that transmit and receive radio signals from wireless devices.

What is a rooftop antenna tower?

Roof top antenna towers facilitate radio, TV, and Wi-Fi signal transmission. In Chicago, rooftop antennas support local TV broadcasting, leveraging telecom rooftop towers for reliable signal delivery. Rooftop telecommunication towers provide last-mile connectivity for wireless internet service providers (WISPs) and utilities.

What are the components of a base station?

The base station will have one or more RF antennas installed to transmit and receive RF signals from other devices. The block diagram of a base station typically includes the following key components: Baseband Processor: The baseband processor too deals with different communication protocols and interfaces with mobile network infrastructure.
