## Overview

---

What is the generalized architecture of proposed battery management system (BMS)?

The generalized architecture of Proposed BMS design is shown in Fig. 9 (a)-(b). In proposed design, battery management systems (BMS) employ LTC6812 analogue front end (AFE) IC to monitor and regulate battery cell conditions. AFE has cell voltage sensor and external balancing circuitry MOSFET driving connections.

What is a battery management system (BMS)?

The battery management system (BMS) monitors the battery and possible fault conditions, preventing the battery from situations in which it can degrade, fade in capacity, or even potentially harm the user or surrounding environment.

What is a 48 volt battery management system (BMS)?

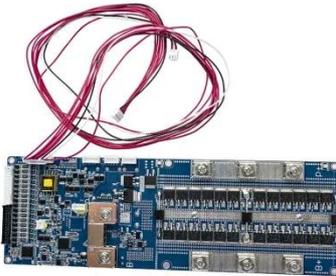

This system design is for a 48-V nominal lithium-ion or lithium-iron phosphate battery management system (BMS) to operate over a range of approximately 36 V to 50 V using 12 to 15 cells depending on the selected battery chemistry.

How do I design a 12-cell lithium-ion battery management system (BMS)?

A complete 12-cell lithium-ion Battery Management System (BMS) can be designed using modular Quickboards schematic blocks. This guide outlines how to architect and assemble each part of the system using proven reference designs for voltage monitoring, current and temperature sensing, relay control, power conversion and distribution.

### How to Design a Battery Management

Introduction  
 Improving State-of-Charge (SOC) and State-of-Health (SOH)  
 Accuracy  
 AFE Direct Fault Control  
 High-Side vs. Low-Side Battery Protections  
 AFE Safety Functions  
 Conclusion  
 When designing a BMS, it is important to consider where the battery protection circuit-breakers are placed. Generally, these circuits are implemented with N-channel MOSFETs since they have a lower internal resistance compared to P-channel MOSFETs. These circuit-breakers can be placed either on the high side (positive terminal of the battery) or the low side (negative terminal of the battery).
