Battery BMS production

Overview

What is battery management system (BMS)?

Battery Management System (BMS) is the “intelligent manager” of modern battery packs, widely used in fields such as electric vehicles, energy storage stations, and consumer electronics.

What is a BMS used for?

BMSs are used in various applications, including Electric Vehicles (EVs), smartphones, renewable energy storage systems, and other devices powered by rechargeable batteries. The building unit of the battery system is called the battery cell. The battery cells are connected in series and in parallel to compose the battery module.

How are battery management systems changing?

Battery management systems are changing faster than ever, and three major technological changes are about to reshape how these vital systems work and connect with their surroundings. AI and machine learning are bringing new capabilities to BMS through advanced predictive analytics.

How does a battery management system work?

Protection mechanisms act as vital safeguards against potential risks. A well-laid-out battery management system uses multiple protection layers to keep batteries operating safely in all conditions. The battery management system’s voltage protection circuits monitor pack voltage and individual cell voltages continuously.
