Communication Energy Storage ESS and Base Station Batteries

Overview

Which battery-based ESS is best?

Among a variety of battery-based ESSs, the ESSs that employ spent electric vehicle (EV) lithium-ion batteries (LIBs) have been regarded as the most promising approach . Spent EV LIBs still have 80 % of their nominal capacities, and it can still be used in ESS systems with lower requirements on battery performance .

Can EV libs be used in ESS systems?

Spent EV LIBs still have 80 % of their nominal capacities, and it can still be used in ESS systems with lower requirements on battery performance . The secondary use of spent LIBs can also relieve the significant pressure on the end-of-life (EoL) management of EVs.

Which ESS is used for load shifting in CBS?

In Case 2 and 3, ESSs with battery packs are deployed in CBS for load shifting. The CBS electricity demand in the peak period is satisfied by the ESS, while in other periods the electricity is supplied directly by the grid. The ESS is charged during periods of low electricity demand.

Can secondary libs be used as a backup ESS?

Based on our former research on the environmental feasibility of secondary use of LIBs as a backup ESS in the CBSs , this study further investigates the environmental and economic gains or burdens of using secondary LIBs for load shifting, with the existing power demand and CBS deployment considered.
