# Cuba overseas warehouse dispatches energy storage power supply

## Overview

---

Why is the energy crisis teetering in Cuba?

Cuba is in the throes of a severe energy crisis, driven by fuel supply disruptions and compounded by obstacles in securing vital technologies and supplies needed to modernize and operate its aging power plants. The situation, exacerbated by U.S. sanctions, has left the nation's energy system teetering.

Where does Cuba's energy supply come from?

Cuba's energy supply mainly comes from oil products, accounting for over 80% of power generation.

How is power produced in Cuba?

About 40.6% of Cuba's power generation is produced in thermal power plants, 21.7% with fuel oil engines, and 21.9% with diesel engines. Almost 8% is produced with the accompanying gas from oil production, 5% comes from renewable energy sources (hydro, solar, and wind), and the remaining 3% is produced by floating units (thermal power barges).

Why is Cuba's power system deteriorating?

As POWER has reported, Cuba's power system has faced increasing strain since 2021, with blackouts becoming more frequent due to accidents at key generation units and aging thermal power plants. Thermal plants are outdated, with most surpassing their 30-year lifespan.
