## Overview

---

What is wind power and how does it work?

Wind power, also known as wind energy, is a form of renewable energy that harnesses the power of the wind to generate electricity. It works by using wind turbines to convert the turning motion of blades, pushed by moving air (kinetic energy), into electrical energy (electricity).

What is wind energy?

Wind energy is a form of carbon-free, renewable energy, which today makes electricity at a lower average cost than any other form of new-built energy.

How do wind power stations work?

A wind power station, often known as a wind farm, captures wind's kinetic energy and turns it into electricity. Here's an explanation of how do wind power stations work internally: 1. Wind Turbines: Wind turbines are the principal component of a wind power facility. They consist of enormous blades attached to a hub installed on top of a tall tower.

How does distributed wind energy work?

Distributed wind energy describes wind energy projects that serve local energy demand, generating on-site electricity for homes, schools, businesses, and farms. These projects can be owned and run by a utility company that then sells the power to users connected to the electrical grid.
