## Overview

---

What is uninterruptible power supply (UPS)?

Uninterruptible power supply (UPS) is the last line of defense to ensure the safe and stable operation of the key equipment of the communication base station. There are many stringent requirements on the security and reliability of BMS, and dauntu energy storage has made full preparations.

What is a ups & how does it work?

What is a UPS?

A UPS (Uninterruptible Power Supply) is a system designed to provide instant power backup when the main power supply fails. Think of it as your safety net—the thing that kicks in immediately when everything else goes dark.

Do UPS systems use batteries?

UPS systems typically use batteries to provide backup power. These batteries can offer short-term power to keep equipment running or allow for safe shutdowns. Energy Storage Technologies employ various storage methods, including batteries, supercapacitors, compressed air energy storage (CAES), gravity storage, and thermal storage.

What is a capacitive uninterruptible power supply?

This will dictate the type and size of the energy storage. The capacitive uninterruptible power supplies are suitable as base devices for critical applications and high system availability, such as interconnected industrial systems in the automotive sector or in intralogistics, as well as for high-current applications with short buffer times.
