Explosion-proof standards for energy storage containers

Overview

How do I design an explosion prevention system for an ESS?

The critical challenge in designing an explosion prevention system for a ESS is to quantify the source term that can describe the release of battery gas during a thermal runaway event.

Can a flammable battery gas source be used for explosion control?

NFPA 855 recommends that a UL 9540A (ANSI/CAN/UL, 2019) test be used to evaluate the fire characteristics of an ESS undergoing thermal runaway for explosion control safety systems. An approach to determine a flammable battery gas source term to design explosion control systems has been developed based on UL 9540A or similar test data.

Does the explosion prevention system work with other fire protection features?

The explosion prevention system functionality presented in this work is limited to removing flammable battery gas generated due to the non-flaring decomposition of batteries and does not consider its interactions with other fire protection features. 1. Introduction.

Can a standard exhaust ventilation method be used to design an explosion prevention system?

This arrangement makes it difficult to use a standard exhaust ventilation methodology to design an explosion prevention system. An innovative approach is used to purge the battery gas from individual Powin Stacks™ and from the main enclosure during a thermal runaway event.
