# How to check the battery when the inverter of solar container communication station is connected to the grid

### System Topology

## Overview

---

Make sure the inverter can start normally, observe the display, and confirm that the battery level is normal. Check that the output voltage of the inverter matches the specifications of the batteries. How do I know if my solar inverter is working?

Reading your solar inverter display is essential for monitoring your solar system's performance. Key terms include: Stand By: Not enough DC voltage from the battery or PV source. Fault: An issue with the inverter that needs fixing to avoid energy outages. PV Grid On/In Use: Normal operation, sending energy generation to the AC electricity grid.

Do inverters and batteries need to match?

The inverter and batteries must match in terms of voltage, capacity, and power output. If you are using a 12V battery, then the input voltage of the inverter must match the battery voltage. If the specifications of the battery and the inverter do not match, the system will not operate stably and may even damage the equipment.

Do solar panels need an inverter?

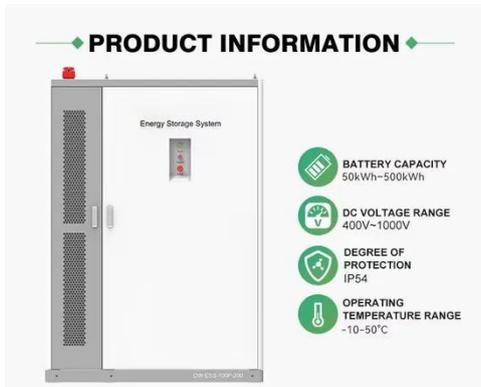

If you are in a solar RV or live off the grid, you undoubtedly have an inverter in your system. It's the perfect match for solar panels because it converts DC power to AC power. Most inverters have a display which indicates the battery charging status. If there is no display, a light or sound will notify you when the battery is fully charged.

What does PV Grid on/in use mean?

PV Grid On/In Use: This indicates the normal operation of the solar inverter on the grid. The entire production from the PV source is sent to the AC grid, which then distributes it to your local grid station. PV Charge: This means the power produced by the PV panels is within the normal range and charges the inverter's batteries.
