# Installation of monocrystalline silicon and polycrystalline silicon solar panels

## Overview

---

What is a monocrystalline solar panel?

Monocrystalline solar panels have black-colored solar cells made of a single silicon crystal and usually have a higher efficiency rating. However, these panels often come at a higher price. Polycrystalline solar panels have blue-colored cells made of multiple silicon crystals melted together.

Should you choose monocrystalline or polycrystalline solar panels?

Choosing between monocrystalline and polycrystalline solar panels depends on your energy needs, budget, and available space. Monocrystalline panels offer higher efficiency and better performance in limited space, while polycrystalline panels provide a more budget-friendly option with reliable output.

What are polycrystalline solar panels?

Polycrystalline solar panels are made from silicon crystals that are melted together. Instead of using a single crystal, the silicon used in polycrystalline panels is composed of multiple smaller crystals. This results in a panel with a slightly less efficient energy conversion rate compared to monocrystalline panels.

How much power does a monocrystalline solar panel produce?

Most monocrystalline panels on the market today will have a power output rating of at least 320 watts, but can go up to around 375 watts or higher! Polycrystalline panel efficiency ratings will typically range from 15% to 17%. The lower efficiency ratings are due to how electrons move through the solar cell.
