

## **EQACC SOLAR**

# **Is there power in the neutral line of the battery cabinet output**

## Overview

---

What is the difference between a positive and a negative battery?

The live could be at 1000V+120V and the neutral could be at 1000V relative to ground. Most cars (all modern cars) use the positive battery terminal as "live" and the negative terminal as "ground." So the negative is kind of like the neutral, and the positive is kind of like the live wire in an AC system.

Can a battery have a live terminal?

So, if your definition of "live" is "the one that isn't ground", then sure, a battery can have a live terminal, but you have to have labelled the other one as "ground" first. No. The only reason line power has a neutral is because that neutral is connected to the Earth somewhere.

Does a stationary UPS need a single output receptacle?

Exception: This requirement does not apply to a stationary UPS provided with a single output receptacle. One result of breaking the input Neutral and Hot connections when operating on battery is that you may be able to measure voltage between Neutral and Ground at the output receptacles when the UPS is on battery.

What is the difference between city power input and battery input?

City power input involves connecting to a 220V or 380V power source, with the live wire connected to L and the neutral wire connected to N. E. Battery input to the host involves connecting positive to positive and negative to negative. Be sure not to reverse the connections. F.

## Is there power in the neutral line of the battery cabinet output
