# **Is there still a market for energy storage cabinet batteries**

## Overview

---

Is battery storage the future of energy?

In the brave new energy world of the not-so-distant future, battery storage is thought to make possible boundless clean energy and convenient technologies like fully electric vehicles and multiple hand-held devices, even though batteries are not particularly cost-effective relative to larger storage methods such as pumped hydro or compressed air.

Will commercial battery deployments overtake residential build by 2030?

Commercial battery deployments overtake residential build by 2030 in BNEF's latest outlook, thanks to updated assumptions on attachment rates, which refer to the percentage of solar installations that are paired with a battery. Lithium iron phosphate (LFP) remains the prevalent lithium-ion battery chemistry in the stationary energy storage market.

Who makes battery chemistry?

Most major battery makers, such as Contemporary Amperex Technology Co. Ltd. (CATL), BYD, EVE Energy, CALB and Hithium, develop products specifically for the energy storage market, driving a continued deviation from the electric-vehicle chemistry mix, which features a larger proportion of nickel-based lithium-ion battery chemistries.

Should energy storage be removed from energy grid connection?

For energy storage, the new Chinese policy emphasized the need to remove energy storage as a prerequisite for renewable energy project grid connection, a requirement that has been a major driver for battery build. Nonetheless, BNEF still expects strong demand for batteries, as the policy doesn't explicitly require mandates to stop.
