Micro battery energy storage

Overview

Why do we need microelectronic energy storage devices?

The development of microelectronic products increases the demand for on-chip miniaturized electrochemical energy storage devices as integrated power sources. Such electrochemical energy storage devices need to be micro-scaled, integrable and designable in certain aspects, such as size, shape, mechanical properties and environmental adaptability.

Do microelectronic devices need rechargeable batteries?

Although most microelectronic devices still rely on rechargeable batteries, this dependence inevitably limits their operational lifespan. A widely adopted strategy to extend system autonomy involves integrating energy harvesting modules with on-board energy storage. This approach enables continuous in situ capture and storage of ambient energy.

Are lithium ion batteries suitable for microelectronic devices?

Such electrochemical energy storage devices need to be micro-scaled, integrable and designable in certain aspects, such as size, shape, mechanical properties and environmental adaptability. Lithium-ion batteries with relatively high energy and power densities, are considered to be favorable on-chip energy sources for microelectronic devices.

Can micro lithium-sulfur batteries improve energy storage capacity?

To further enhance energy storage capability, micro lithium-sulfur (Li-S) batteries have emerged as a promising alternative. These systems leverage the low electrochemical potential of lithium metal anodes (-3.04 V vs. standard hydrogen electrode) and the high theoretical capacity of sulfur cathodes (1675 mA h g^{-1}).
