# **Nominal voltage of solar cell module**

## Overview

---

Used just for classification, it is not a real voltage you are going to measure. It is not a fixed voltage either and, normally, it is not mentioned in the specification sheet of a PV module. Some of the common par.

What is a nominal voltage solar panel?

**Nominal Voltage.** This is your typical voltage we put on solar panels; ranging from 12V, 20V, 24V, and 32V solar panels. Open Circuit Voltage (VOC). This is the maximum rated voltage under direct sunlight if the circuit is open (no current running through the wires). Example: A nominal 12V voltage solar panel has an open circuit voltage of 20.88V.

What is the voltage of a solar panel?

It is 12V or 24V. The voltage of a solar panel mainly depends on the solar panel type, size, cells, etc. Whether it be open circuit voltage, maximum power voltage, or nominal voltage, you will find it all in the datasheet of the manufacturer. Generally, the nominal voltage of any solar panel is 12V or 24V.

Do solar panels produce a higher voltage than nominal voltage?

As we can see, solar panels produce a significantly higher voltage (VOC) than the nominal voltage. The actual solar panel output voltage also changes with the sunlight the solar panels are exposed to.

How to calculate solar panel output voltage?

If you know the number of PV cells in a solar panel, you can, by using 0.58V per PV cell voltage, calculate the total solar panel output voltage for a 36-cell panel, for example. You only need to sum up all the voltages of the individual photovoltaic cells (since they are wired in series, instead of wires in parallel).
