# Off-grid mobile energy storage container government procurement

## Overview

---

What is grid charging?

“Grid charging” refers to the charging of the energy storage system from energy on the power grid (as opposed to a paired energy generation resource such as wind or solar).

How does the US power grid work?

The US power grid operates on an AC current at 60 Hz. Most renewable generation (wind and solar) and battery energy storage generate direct current, meaning that the flow of electrons is in only one direction. A transformer is required to transform this DC into AC so that it can be transmitted onto the power grid.

Can federal agencies implement microgrids at their sites?

Report explores procurement options and agreements that may be useful to federal agencies interested in implementing microgrids at their sites. The free, online REopt platform is designed to help building owners, developers, utilities, researchers, and everyday citizens understand their optimal energy solution.

What is a microgrid fact sheet?

Fact sheet provides an overview and actionable next steps in the microgrid implementation process. Animation simulates grid-connected and islanded energy flows among distributed energy resources at a military base—while connected to the grid, and while islanded during a grid disturbance.
