Principle of electric shock in solar power generation system of solar container communication station

Overview

How solar energy is generated?

The PV technology convert visible spectrum to electricity and thermal collectors use both infrared and visible spectrum for energy generation. So the energy generation from solar radiation can be in the form of electrical energy or thermal Energy. The various conversion paths of solar energy is described in the Fig.2.

How does solar energy work?

As majority of our energy requirements are in the form of electricity, PV works on the principle of photovoltaic effect. The generation of thermal energy from solar can be realized using various solar reflecting collectors. Most of the technology works on the principle of reflection, radiation and convection or based on the thermosiphon effect.

How does a photovoltaic system work?

Photovoltaic systems use the photovoltaic effect to convert solar energy into electrical power. Solar panels directly convert sunlight into electricity. They are usually made of semiconductor materials like silicon. Photons from sunlight excite electrons in the solar cells, causing an electrical current to flow (Kumar et al. 2022d).

What is solar energy?

Solar energy is a renewable and sustainable form of power derived from the radiant energy of the sun. This energy is harnessed through various technologies, primarily through photovoltaic cells and solar thermal systems.
