# **Russia St Petersburg supercapacitor model**

## Overview

---

How to model a supercapacitor?

Here, it is shown that consistent modelling of a supercapacitor can be done in a straightforward manner by introducing a dynamic equivalent circuit model that naturally allows a large number or a continuous distribution of time constants, both in time and frequency domains.

Can a dynamic equivalent circuit be used to model supercapacitors?

The aim of this study was to demonstrate that the dynamic equivalent circuit can be used to model the behaviour of supercapacitors if one allows for an interpretation in terms of a distribution of relaxation times.

Can a supercapacitor model be used for energy storage?

The simulation results have verified that the proposed model can be applied to simulate the behaviour of the supercapacitor in most energy and power applications for a short time of energy storage. A supercapacitor test circuit is given to test the charge and discharge of supercapacitor modules.

What is the role of relaxation times in a supercapacitor model?

Distribution of relaxation times provides an indicator of charge dynamics at the electrodes. Both time dynamics (charging and self-discharging) and impedance spectroscopy can be studied within the model. Supercapacitors are often modelled using electrical equivalent circuits with a limited number of branches.
