

Selection of generator sets for fixed power stations

Overview

What are generator sets used for?

Available in power ranges from 5 to 3,900 kVA, these generator sets are a widespread solution in the market. They are essential for emergency power supply in critical services such as hospitals, shopping centres, and data centres. They are also used in industrial processes to provide a reliable and powerful power source.

What type of generator do I Need?

For domestic use, up to 18 kW, you will need a single-phase generator set, except possibly for some very energy-intensive equipment such as heat pumps. For professional use, you will probably need a three-phase generator set to supply machines that require more power. Some three-phase generator sets are equipped with single-phase outlets.

What are the different types of generating sets?

Below, we explain in detail the most important types of generating sets according to six key criteria: 1. Depending on the type of engine or fuel Diesel generator sets: Power up to 4000 kVA. Ideal for hospitals, industries, data or energy centers. High reliability and efficiency. Hybrid gensets: Combine engines with batteries or solar energy.

How to choose a generator set?

It will also be necessary to define the motor type, for example a gasoline engine if you are looking for a small compact generator set, a diesel engine if you are looking for a large generator set or a gas or turbine engine if this energy source is available and you want a more economical and less polluting set.
