Solar System Protection Device

Overview

What are solar surge protection devices (SPDs)?

1. What Are Solar Surge Protection Devices (Solar SPDs)?

A Solar Surge Protection Device (Solar SPD) is a protective electrical component designed to divert or absorb transient overvoltage events, such as lightning strikes or switching operations, before they can damage sensitive solar equipment.

How to choose a DC surge protection device for solar?

There are three types of DC SPD available for solar. So, you need to choose the DC surge protection device based on your needs. The type 1 surge is designed to handle direct lightning strikes. This device is installed at the primary inlet of the power supply. Additionally, it protects a wide area.

What are the different types of solar surge protection devices?

Types of solar surge protection device (SPD) In solar/PV applications, SPDs could be classified into three types based on their resistance: Type 1, Type 2, and Type 1+2. Type 1 SPD: Cope with a direct strike which brings an energetic surge. Type 2 SPD: Reduces overvoltages coming from numerous sources.

How does a solar surge protection device work?

The solar surge protection device is in a high-impedance state and has no impact on the solar PV system at typical operating voltages. When a transient voltage occurs on the circuit, the SPD moves into a state of conduction (or low impedance) and diverts the surge current back to its source or ground.
