Solar glass length

Overview

What are the characteristics of glass for solar applications?

For solar applications the main attributes of glass are transmission, mechanical strength and specific weight. Transmission factors measure the ratio of energy of the transmitted to the incoming light for a specific glass and glass width. Ratio of the total energy from an AM1-5 source over whole solar spectrum from 300 - 2,500nm wavelength.

How much solar energy does commercial glass produce?

Base-line commercial glass has a solar transmission of 83.7%. I.e. 16.3% of the sun's energy do not even get to the PV material. The energy loss is due - in equal parts - to reflection on the surface and absorption within the glass due to iron impurities. The density of glass is about 2,500 kg/m³ or 2.5kg/m² per 1mm width.

What G-value should a Photovoltaic Glass have?

Photovoltaic glass can be customized to achieve a solar factor between 6% and 41%. A low g-value is desirable to prevent overheating, especially in warm climates, as it prevents the interior temperature from rising too high due to the greenhouse effect.

What is a solar glass heat-treating system?

Solar glass heat-treating systems designed with our collective future in mind. Most solar technologies use specialized glass substrates in some way. The glass must meet the rigid specifications needed by solar products perform as specified. Glasstech provides precisely bent or curved glass equipment solutions for concentrating solar power

Solar glass length

SCHOTT Technical details and key properties of SCHOTT® Solar Glass

Discover the technical properties of SCHOTT® Solar Glass: high transmission, radiation protection, surface precision, and stability for lasting performance.
