Solar glass panel one meter

Overview

What is a mono glass solar panel?

Mono-glass (single-glass) solar panels use tempered glass on the front and a polymer backsheet on the rear. This design is reliable and widely used in most homes. Glass-glass (double-glass) panels use glass on both sides. Many are bifacial, meaning they can collect sunlight from the back too. This design can boost energy on reflective surfaces.

Why should you choose Onyx Solar Photovoltaic Glass?

The multifunctional properties of photovoltaic glass surpass those of conventional glass. Onyx Solar photovoltaic glass can be customized to optimize its performance under different climatic conditions. The solar factor, also known as “g-value” or SHGC, is key to achieve thermal comfort in any building.

What is the difference between mono-glass and glass-glass panels?

Mono-glass panels cost 10–20% less upfront. They are lighter, faster to install, and easier to maintain. Glass-glass panels cost more. Bifacial models and extra glass add to production, shipping, and labor costs. Still, for big, sunny, reflective sites, glass-glass can recover the higher cost with extra generation.

What G-value should a Photovoltaic Glass have?

Photovoltaic glass can be customized to achieve a solar factor between 6% and 41%. A low g-value is desirable to prevent overheating, especially in warm climates, as it prevents the interior temperature from rising too high due to the greenhouse effect.
