Solar power cable threading method on base station

Overview

Is DC-string cabling a problem for solar photovoltaic (PV) systems?

Figure 1. Photo from Gerald Robinson, Lawrence Berkeley National Laboratory (LBNL) Issues with DC-string cabling (wiring) on solar photovoltaic (PV) systems are emerging as a significant area of concern related to system failures, underperformance, and safety issues.

Do solar PV systems need safe DC cable management?

As of the 2020 revision of the NEC (NEC 2020), all references to safe DC cable management in solar PV systems have been moved into section 690. Since many of the existing systems were installed under earlier versions of the NEC, it is important to understand requirements from earlier versions in order to assess existing arrays.

What type of wire ties do solar panels use?

Use of standard grades of plastic wire ties is by far the most common method used by installers to support and secure direct current (DC) string wiring in an array. At least some of these standard grades of ties fail well before the useful life of the solar PV system.

How long should a solar panel wire be secured?

Secured within 12 inches of each box, cabinet, conduit body, or other termination. Section also is applicable to residential non-metallic wiring (under tradename “Romex”) practices and has resulted in application confusion with solar PV systems.
