Solar thin film power generation curved tiles

Overview

What is solar irradiance absorbed by curved PV roof tiles?

The solar irradiance absorbed by the curved PV roof tiles equals the sum of the solar irradiance reaching the flat microfacets belonging to the curved surface; The airflow inside all the curved air channels is uniform, and there is no air leakage during the air handling process; Air is regarded as the ideal gas;.

What is a curved-type PV roof integrated with flexible PV tiles?

The curved-type PV roof integrated with flexible PV tiles is a novel attempt to implement the building-integrated photovoltaic/thermal technology into diverse genres of architectural design.

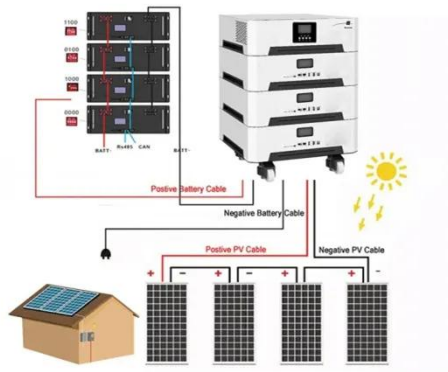

What is curved flexible PV roof tile?

The curved flexible PV roof tile comprises the front plate, the thin-film PV cells, and the back plate. The front and rear plates are ultra-clear-tempered glass. The curved surface is set as cylindrical of 120° . The air fan installed in the air duct would guide the inlet air and flow through the curved PV/T unit.

How much electricity does a thin-film PV roof produce?

For the annual electrical power yield, the thin-film PV roof facing east, southeast, southwest, and west are 324.06 kWh, 353.21 kWh, 353.80 kWh, 324.75 kWh (by PVsyst); according to the self-established model, the annual electrical power yield is 335.99 kWh, 368.38 kWh, 367.57 kWh, and 334.71 kWh. Fig. 8.
