**The battery cabinet  
automatically cuts off power  
when the current is too high**

**51.2V  
200Ah/300Ah  
LiFePO4 battery**

## Overview

---

What happens when a battery reaches full capacity?

When charging a battery, continuous power flow after the battery reaches full capacity can lead to overheating, overcharging, and eventual damage. This circuit automatically disconnects the charging source when the battery is fully charged, preventing further current flow.

What is a 12V auto cutoff battery protection circuit?

This 12V auto cutoff battery protection circuit is designed to automatically disconnect the battery from the charging source when it reaches full charge, preventing overcharging and extending battery life. At the core of the circuit is the TL431, a programmable shunt voltage regulator that monitors the battery voltage.

What is over current cut-off power supply circuit using Arduino?

By Girish Radhakrishnan The proposed over current cut-off power supply circuit using Arduino has 16 X 2 LCD display, which is used to show case the voltage, current, power consumption and preset threshold current limit in real time. Being an electronics enthusiast, we test our prototypes on a variable voltage power supply.

What happens when a battery reaches full charge?

**Full Charge and Shut-Off:** The battery's current demand reduces as it approaches its full charge level. As a result, there is almost no voltage differential across the resistor. The voltage at pin 2 now exceeds the voltage at pin 3 as a result of this modification.
