Overview

What happens if a power inverter goes out?

The inverter remains in battery mode until the grid supply is restored. Once the mains return, it automatically reverts to charging mode to replenish the battery in inverter. During prolonged outages, efficient power usage becomes essential to prevent rapid battery drain.

How does a battery inverter work?

The inverter pulls power from the battery to keep your appliances going. The more amps drawn the faster the battery power goes down. But if you charge it, the amps pulled from the battery will be augmented by the charger. Doing this will conserve the battery duty cycle, and this is the most important element in prolonging battery life.

Do inverters need batteries?

For most residential and small commercial setups, the traditional battery and power inverter combo is the preferred choice to ensure continuous power supply during blackouts. So, while some inverter types do not require batteries, if your priority is uninterrupted backup power, investing in a quality battery in inverter system is essential.
