UPS uninterruptible power supply is a government procurement

Overview

What is an uninterruptible power supply (UPS)?

An uninterruptible power supply (UPS), also known as a continuous power supply (CPS) or a battery backup is a device which maintains a continuous supply of electric power to connected equipment by supplying power from a separate source when utility power is not available.

How efficient is an UPS system?

The efficiency of UPS systems varies with loading; typically the more highly loaded they are, the more efficient. Lightly loaded systems could be losing 15% or more of the energy supplied to the equipment downstream. The loss is from the power conversion within the UPS, which creates heat that must then be managed.

What types of UPS products are excluded?

UPS products that are internal to computers or other electronic devices; designed for industrial applications; part of an electric transmission or distribution system; used in mobile (e.g., marine, airborne) applications; or part of a cable television network are excluded. This acquisition guidance was updated in December 2022. Did you know?

.

What is the ENaC code for UPS?

Identification codes for product categories covered by sustainable acquisition requirements are provided by DLA and the United Nations Standard Products and Services Code (UNSPSC). GSA offers UPS through Multiple Award Schedule IT Hardware 33411. DLA does not currently offer an ENaC for UPS models. The UNSPSC for UPS is 39121011.
