

# Voltage change of solar panels in series

## Overview

---

Why are solar panels wired in series?

Solar panels are wired in series when you want to increase the total voltage in a system. In this configuration, the voltage outputs of all panels add up while the current remains low on a level of what a single solar panel can provide. Connecting solar panels in series increases the total voltage in a system way over the safe level.

What happens if a solar panel is connected in series?

That is connecting solar panels in series increases the voltage of the system, so two panels connected in series will produce double the voltage as compared to just one panel but while the voltages add up, the amperage of each panel stays the same, that is currents in series do not add up.

What is the difference between series and parallel solar panels?

The essential differences between series and parallel wiring of solar panels are reflected in their effects on voltage and current. A series connection can increase the total system voltage while keeping the current constant.

How do photovoltaic solar panels increase the voltage output?

All photovoltaic solar panels produce an output voltage when exposed to sunlight and we can increase the voltage output of the panels by connecting them in series.
