# What does battery module mean

## Overview

---

What is the difference between a battery and a module?

Each component serves a unique role: battery cells are the individual units that store energy, modules are groups of cells connected together, and packs are assemblies of modules that deliver power to the device. Here's a brief overview of these key differences. Let's break it down.

How does a battery module work?

In a battery module, several cells are connected in series and parallel configurations to achieve the desired voltage and capacity. The cells work together to supply power efficiently, while balancing the load across all cells. The BMS is a crucial component of the battery module that ensures safe and efficient operation.

What are battery cells & modules & packs?

Battery cells, modules, and packs are different stages in battery applications. In the battery pack, to safely and effectively manage hundreds of single battery cells, the cells are not randomly placed in the power battery shell but orderly according to modules and packages. The smallest unit is the battery cell. A group of cells can form a module.

What are the components of a battery module?

Each cell typically consists of a positive electrode (cathode), a negative electrode (anode), and an electrolyte that facilitates the movement of ions. In a battery module, several cells are connected in series and parallel configurations to achieve the desired voltage and capacity.
