

# What kind of construction land is used for energy storage power stations

## Overview

---

What is the primary architectural objective of a power station?

The prime architectural objective would be to ensure the best possible appearance of the project, including buildings, structures and plant as seen from such viewpoints as are predominant in the public's perception of a power station, and to present a confident and consistent image as part of the CEGB's corporate design policy.

What is the purpose of landscaping a power station?

Landscape work within the scope and ability of a power station construction can rarely be used to hide major structures. Hence the idea that the purpose of landscaping is to screen ugliness is true only in a very small degree. It is best perceived as a base setting from which the main buildings are seen to rise.

How are power station foundations constructed?

The construction of the power station foundations is carried out in accordance with a detailed programme drawn up to provide the various foundations and general site works, in the sequence necessary to enable the building work and plant installation to proceed in accordance with the overall construction programme.

What makes a good power station design?

The best power station design is the one for which consent can be obtained, and to achieve this economically in landscape terms, a range of expertise and activities is required. The proposed site must be visually analysed by the appointed landscape architect, who will seek to minimise adverse effects of the project.
