What is espower esp8266-01?

ESPower is a motherboard for ESP8266-01 with voltage regulator, voltage protection and Li-Ion battery charger integrated. It has been designed to run off intermittent 5V USB power supply but it can also be powered by a small 6V Solar panels. Low power consumption has been kept in mind.

Is ESP 8266 battery powered?

For battery powered ESP 8266 projects we would like to have a full control over electrical components that we use on board. This is because everything that draws power will also drain our battery, and this is something we want to avoid. The Wemos D1 Mini module seems to have the lowest memory consumption of them all, but we can still be better.

Can a sensor damage ESP8266 board?

If a sensor uses a lot of power, it can damage the ESP8266 board. Instead, sensors and displays should be powered separately. However, using two or more power sources is not very convenient. The best solution is to use a single power source with this power splitter set. The power splitter provides two connections:.

What is ESP8266 power path & voltage detector?

Power path to select if the board is always powered by the battery or is also powered by VCC when an external power supply is provided. Voltage detector to properly switch off the ESP8266 when the battery voltage is too low for proper operation. This prevent crashes of the ESP when the battery is drained.
