# What systems do wind turbines have

## Overview

---

How does a wind turbine work?

A wind turbine works by converting kinetic energy from the wind into electricity. The blades turn between 13 and 20 revolutions per minute, with the velocity of the rotor varying in relation to the velocity of the wind to reach greater efficiency.

What is a wind turbine used for?

wind turbine, apparatus used to convert the kinetic energy of wind into electricity. Wind turbines come in several sizes, with small-scale models used for providing electricity to rural homes or cabins and community -scale models used for providing electricity to a small number of homes within a community.

What are wind energy systems?

Wind energy systems harness the kinetic energy from wind and convert it into electricity, playing a crucial role in the global shift towards sustainable energy solutions.

What are the main parts of a wind turbine?

A wind turbine can be divided into five basic parts to understand its structure: base, tower, nacelle, and rotor. These parts work together to harness the power of wind and generate electricity.
