# **Which inverter to use for solar panels**

## Overview

---

What is a solar inverter?

Solar inverters are the heart of any solar energy system, converting the direct current (DC) electricity generated by solar panels into alternating current (AC) power for homes, businesses, or utility grids.

What type of solar inverter do I Need?

**String Inverters:** The most common type for residential solar systems. This inverter connects multiple solar panels to a single unit, and if one panel fails, it doesn't affect the entire system's efficiency. It's the ideal choice for most residential users.

Can a solar inverter power a home?

Without a solar inverter, you wouldn't be able to use those solar panels to power your home. A solar inverter's job is simple: It converts the direct current -- the electricity generated by your solar panels -- into alternating current electricity that your appliances run on.

What are the different types of solar inverters?

For instance, a microinverter system can increase energy output by up to 25% in partially shaded areas. String inverters connect a series (or "string") of panels to a single inverter. These are the most common type used in residential and commercial solar systems.
